# Similarity-based Recommendation

Rodrygo L. T. Santos  
rodrygo@dcc.ufmg.br

# Content-based recommendation

You bought

*Similar artist: Pink Floyd*  
*Similar origin: England*  
*Similar genre: Rock*  
*Similar period: 1970s*

You may like

# Content-based recommendation

## Collaborative filtering

- Leverages item ratings
- Agnostic to item content

*Applicable to any kind of item (e.g., text, audio, video, food)*

## Content-based filtering

- Leverages item content
- Agnostic to item ratings

*Applicable even in extreme cold-start scenarios*

# Vector representation

Each item is a vector

- One component for each term
- High dimensionality

Each user is a vector

- Some combination of item vectors

*How to weight term occurrences?*

# Occurrence-based weighting

Each item is a vector in  $\{0, 1\}^{|V|}$

	Anthony and Cleopatra	Julius Caesar	The Tempest	Hamlet	Othello	Macbeth
ANTHONY	1	1	0	0	0	1
BRUTUS	1	1	0	1	0	0
CAESAR	1	1	0	1	1	1
CALPURNIA	0	1	0	0	0	0
CLEOPATRA	1	0	0	0	0	0
MERCY	1	0	1	1	1	1
WORSER	1	0	1	1	1	0
...						

*How representative is a term?*

# Count-based weighting

Each item is a vector in  $\mathbb{N}^{|V|}$

	Anthony and Cleopatra	Julius Caesar	The Tempest	Hamlet	Othello	Macbeth
ANTHONY	157	73	0	0	0	1
BRUTUS	4	157	0	2	0	0
CAESAR	232	227	0	2	1	0
CALPURNIA	0	10	0	0	0	0
CLEOPATRA	57	0	0	0	0	0
MERCY	2	0	3	8	5	8
WORSE	2	0	1	1	1	5
...						

*How discriminative is a term?*

# TF-IDF

Given a term  $t$  and an item  $i$

- $\text{tf}_{ti}$ : *term frequency* of term  $t$  in item  $i$
- $\text{idf}_t$ : *inverse document frequency* of term  $t$

$$\text{idf}_t = \log \frac{n}{n_t}$$

- $n$ : number of items in the collection
- $n_t$ : number of items where  $t$  appears

$TF*IDF$ : weight given to each term

# TF-IDF-based weighting

Each item is a vector in  $\mathbb{R}^{|V|}$

	Anthony and Cleopatra	Julius Caesar	The Tempest	Hamlet	Othello	Macbeth
ANTHONY	5.25	3.18	0.0	0.0	0.0	0.35
BRUTUS	1.21	6.10	0.0	1.0	0.0	0.0
CAESAR	8.59	2.54	0.0	1.51	0.25	0.0
CALPURNIA	0.0	1.54	0.0	0.0	0.0	0.0
CLEOPATRA	2.85	0.0	0.0	0.0	0.0	0.0
MERCY	1.51	0.0	1.90	0.12	5.25	0.88
WORSER	1.37	0.0	0.11	4.15	0.25	1.95
...						

# Vector representation

Each item is a vector

- One component for each term
- High dimensionality

Each user is a vector

- Some combination of item vectors

*How to compute similarity?*

# Computing similarities

*a: "social inequality raises"*  
*b: "rich-poor gap grows"*

Euclidean distance

- Distance between vectors' endpoints

Cosine

- Angular distance between vectors

*Which similarity?*

# Angle vs. distance

Thought experiment

- Take an item vector  $i_1$
- Append  $i_1$  to itself, forming  $i_2$  (i.e.,  $i_2 = 2i_1$ )

“Semantically”,  $i_1$  and  $i_2$  are equivalent

- The cosine between the two vectors is maximal
- ... the Euclidean distance can be quite large

# Cosine similarity

$$\text{sim}(u, i) = \cos(\vec{u}, \vec{i}) = \frac{\vec{u} \cdot \vec{i}}{\|\vec{u}\| \|\vec{i}\|} = \frac{\sum_{t=1}^{|V|} u_t i_t}{\sqrt{\sum_{t=1}^{|V|} u_t^2} \sqrt{\sum_{t=1}^{|V|} i_t^2}}$$

$\vec{u}$  and  $\vec{i}$  are term-weight vectors

- $u_t$  is the TF-IDF weight of term  $t$  in user  $u$
- $i_t$  is the TF-IDF weight of term  $t$  in item  $i$
- $\|\vec{u}\|$  and  $\|\vec{i}\|$  are the norms of  $\vec{u}$  and  $\vec{i}$

# Quick recap

We know how to represent items

- Each item is a vector over terms

We know how to compute vector similarities

- Cosine of the angle between the vectors

***We can now produce recommendations***

- Rank items by their similarity to the user

*How to  
represent  
the user?*

# Representing the user

User has rated

◦  $i_1$ : ★★ ★

◦  $i_2$ : ★★ ★★ ★

◦  $i_3$ : ★★ ★

User prototype

$$\vec{u} = 3\vec{i}_1 + 5\vec{i}_2 + 3\vec{i}_3$$

# Incremental updates

User has rated

- $i_1$ : ★★
- $i_2$ : ★★★★★
- $i_3$ : ★★
- $i_4$ : ★★★★★

User prototype

$$\vec{u} = 3\vec{i}_1 + 5\vec{i}_2 + 3\vec{i}_3 + 5\vec{i}_4$$

# Rocchio recommendation

Each item is a vector  $\vec{l}$

- One component for each term

Each user is a vector  $\vec{u}$

- $\vec{u} = \frac{1}{|I_u|} \sum_{j \in I_u} r_{uj} \vec{j}$ 
  - $I_u$ : items rated by user  $u$
  - $r_{uj}$ : rating of user  $u$  to item  $j$

Prediction score

- $\text{sim}(\vec{u}, \vec{l}) = \cos(\vec{u}, \vec{l})$

# ***k*-NN recommendation**

Each item is a vector  $\vec{l}$

- One component for each term

Each user is a vector  $\vec{u}$

- $\vec{u}_i = \frac{1}{|N_{ui}|} \sum_{j \in N_{ui}} r_{uj} \vec{j}$ 
  - $N_{ui}$ : neighbors of  $i$  rated by  $u$
  - $r_{uj}$ : rating of user  $u$  to item  $j$

Prediction score

- $\text{sim}(\vec{u}, \vec{l}) = \cos(\vec{u}_i, \vec{l})$

# Summary

Rocchio is a *nearest centroid* recommender

- Items are matched against the user centroid
- Different items will use the same centroid

$k$ -NN is a *nearest neighbor* recommender

- Neighbors are chosen on-demand for each item
- Different items will have different neighbors
